

# Find number of pairs that $x^y > y^x$

Difficulty Level : Hard • Last Updated : 13 Aug, 2022

Given two arrays  $X[]$  and  $Y[]$  of positive integers, find a number of pairs such that  $x^y > y^x$  where  $x$  is an element from  $X[]$  and  $y$  is an element from  $Y[]$ .

**Examples:**

Find number of pairs (x, y)  
in an array such that  $x^y >$

**GeeksforGeeks**  
A computer science portal for geeks

◀ Array Matrix Strings Hashing Linked List Stack Queue Binary Tree Binary Search T ▶

**Input:**  $X[] = \{2, 1, 6\}$ ,  $Y = \{1, 5\}$

**Output:** 3

**Explanation:** There are total 3 pairs where  $\text{pow}(x, y)$  is greater than  $\text{pow}(y, x)$

Pairs are (2, 1), (2, 5) and (6, 1)

## Number of pairs

```
long long countPairsBruteForce(long long X[], long long Y[],
                                long long m, long long n)
{
    long long ans = 0;

    for (int i = 0; i < m; i++)
        for (int j = 0; j < n; j++)
            if (pow(X[i], Y[j]) > pow(Y[j], X[i]))
                ans++;

    return ans;
}
```

## Java

```
public static long countPairsBruteForce(long X[], long Y[],
                                          int m, int n)
{
    long ans = 0;
    for (int i = 0; i < m; i++)
        for (int j = 0; j < n; j++)
            if (Math.pow(X[i], Y[j]) > Math.pow(Y[j], X[i]))
                ans++;

    return ans;
}
```

## Python3

```
def countPairsBruteForce(X, Y, m, n):
    ans = 0
    for i in range(m):
```

```
public static int countPairsBruteForce(X, Y, m, n)
{
    int ans = 0;
    for (int i = 0; i < m; i++)
        for (int j = 0; j < n; j++)
            if (Math.Pow(X[i], Y[j]) > Math.Pow(Y[j], X[i]))
                ans++;

    return ans;
}
```

## Javascript

```
function countPairsBruteForce(X, Y, m, n){
    let ans = 0;
    for(let i=0; i<m; i++){
        for(let j=0; j<n; j++){
            if ((Math.pow(X[i], Y[j]) > Math.pow(Y[j], X[i]))){
                ans += 1;
            }
        }
    }
    return ans;
}
```

**Time Complexity:**  $O(M*N)$  where **M** and **N** are sizes of given arrays.

### Efficient Solution:

The problem can be solved in  **$O(n \log n + m \log n)$**  time. The trick here is if  **$y > x$**  then  **$x^y > y^x$**  with some exceptions.

Following are simple steps based on this trick.

- Sort array Y[].
- For every x in X[], find the index idx of the smallest number greater than x (also called ceil of x) in Y[] using **binary search**, or we can use the inbuilt function `upper_bound()` in C++ STL library.

## Start Your Coding Journey

- If  $x = 1$ , then the count of pairs for  $t$
- If  $x > 1$ , then we also need to add co
- $x$  smaller than  $y$  means  $x^y$  is great
  1.  $x = 2, y = 3$  or  $4$
  2.  $x = 3, y = 2$

meshack kimutai

meshackkimutai34@gmail.com

Continue as meshack

Note that the case where  $x = 4$  and  $y = 2$  is not there

Following diagram shows all exceptions in tabular form. The value 1 indicates that the corresponding (x, y) form a valid pair.

	0	1	2	3	4
0	0	0	0	0	0
1	1	0	0	0	0
2	1	1	0	0	0
3	1	1	1	0	1
4	1	1	0	0	0

In the following implementation, we pre-process the Y array and count 0, 1, 2, 3 and 4 in it, so that we can handle all exceptions in constant time. The array NoOfY[] is used to store the counts.

Below is the implementation of the above approach:

```
// C++ program to finds the number of pairs (x, y)
// in an array such that  $x^y > y^x$ 
```

var Y = [ 1, 5 ];

document.write("Total pairs = " +
countPairs(X, Y, X.length, Y.length));

// This code contributed by umadevi9616

</script>

```

### Output

Total pairs = 3

**Time Complexity:**  $O(n\log n + m\log n)$ , where  $m$  and  $n$  are the sizes of arrays  $X[]$  and  $Y[]$  respectively. The sort step takes  $O(n\log n)$  time. Then every element of  $X[]$  is searched in  $Y[]$  using binary search. This step takes  $O(m\log n)$  time.

**Auxiliary Space:**  $O(1)$
